BEFORE YOU START

What this study records

This is a research instrument. Each signal class below can be switched off on its own, and the practice session works exactly the same way with any of them off — measuring that difference is part of the study.

Answers and outcomes

Which option you chose and whether it was right. Required: without it there is no adaptive practice to take part in.

Timing

How long you took to read, to decide and to submit. Used to estimate pace and within-session fatigue.

Interaction

Option changes, slide gaps, and whether the tab was visible and focused. Used to estimate engagement and hesitation.

Cursor movement

Summary numbers describing the shape of your cursor path — curvature, direction reversals, pauses, hover time per option. The raw path never leaves your browser; only these summaries are stored.

Occasional questions

Now and then, how sure you were and how hard the item felt. Every one is skipable.

SQL BASICS

Question 1

EASY1 / 60

sql_basics - Easy

What does SQL stand for?

Structured Query Language

Simple Query Logic

Standard Question Language

Sequential Query Listing

What the system currently estimates

Serving a difficulty-1 item on sql_basics because no adaptation rule applied to this attempt.

► Concept roadmap

03 state panel and result

ALAdaptive CSE Practice6 Tech CSE question solver

Sequential Query Listing

What the system currently estimates

Knowledge of the current concept

Confidence

Engagement

Fatigue

Serving a difficulty-1 item on sql_basics because no adaptation rule applied to this attempt.

► Concept roadmap

Correct answer

SQL (Structured Query Language) is the standard language for managing and querying relational databases.

DIVIDE_AND_CONQUER

Question 44

HARD84 / 60

divide_and_conquer - Hard

Worked example

To move N disks, you must recursively move N-1 disks to an auxiliary peg (T(N-1)), move the largest disk (1 step), and move the N-1 disks to the destination peg (T(N-1)). This yields T(N) = 2T(N-1) + 1, which solves to 2^N - 1.

For the Tower of Hanoi puzzle with N disks, what is the minimum number of moves required, and what is the recurrence relation governing this problem?

2^N - 1 moves, governed by T(N) = 2T(N-1) + 1

2^N moves, governed by T(N) = 2T(N-1) + 2

N² moves, governed by T(N) = T(N-1) + N

2^N(N-1) moves, governed by T(N) = T(N-1) + 2T(N-2)

05 break suggestion

DIVIDE_AND_CONQUER

Question 45

MEDIUM40 / 60

divide_and_conquer - Medium

Take a short break

Your recent pattern suggests a pause will help more than another item right now.

For the Euclidean recursive GCD algorithm: gcd(a, b) = gcd(b, a % b) with base case b == 0 returning a. How many recursive calls (excluding the initial call) are made to compute gcd(24, 9)?

HomeDashboardReviewphase10-demo2Logout

What the system currently estimates

Knowledge of the current concept

Confidence

Engagement

Fatigue

Serving a difficulty-7 item on divide_and_conquer because recent struggle, slowing response time. It also offers a break suggestion.
